## **UNIT 4 – CHAPTER 4 STUDENT NOTES: TYPES OF REACTIONS**

AP chemistry recognizes three types of chemical reactions:

- 1) Precipitate reactions:  $AX_{(aq)} + BY_{(aq)} \rightarrow AY_{(aq)} + BX_{(s)}$
- 2) Redox reactions: Ca + FeCl<sub>2</sub> → CaCl<sub>2</sub> + Fe
- 3) Acid-Base reactions:  $HA_{(aq)} + BOH_{(aq)} \rightarrow HOH_{(l)} + BA_{(aq)}$

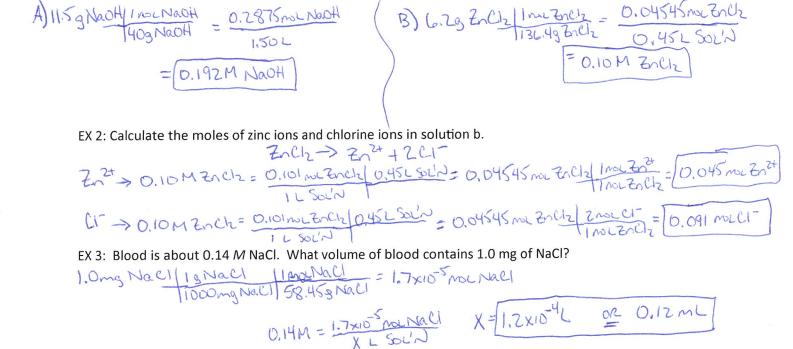

# 1) Precipitate reactions

Molarity (M) – is an expression of concentration

M = moles of solute / liters of solution

EX 1: Calculate the molarity of the following solutions

- a) 11.5 grams of NaOH in 1.50 liters of water
- b) 6.2 grams of ZnCl<sub>2</sub> in 450 milliliters of water

Dilutions: amounts needed to make a solution

Solid

Liquid

## Solubility Rules - pg. 144 of your book

- 1. Most nitrate (NO<sub>3</sub>) salts are soluble.
- 2. Most salts containing the alkali metal ions (Li<sup>+</sup>, Na<sup>+</sup>, K<sup>+</sup>, Cs<sup>+</sup>, Rb<sup>+</sup>) and the ammonium ion (NH<sub>4</sub><sup>+</sup>) are soluble.
- 3. Most chloride, bromide, and iodide salts are soluble. Notable exceptions are salts containing the ions Ag<sup>+</sup>, Pb<sup>2+</sup>, and Hg<sub>2</sub><sup>2+</sup>.
- 4. Most sulfate salts are soluble. Notable exceptions are BaSO<sub>4</sub>, PbSO<sub>4</sub>, Hg<sub>2</sub>SO<sub>4</sub>, and CaSO<sub>4</sub>.
- 5. Most hydroxide salts are only slightly soluble. The important soluble hydroxides are NaOH and KOH. The compounds Ba(OH)<sub>2</sub>, Sr(OH)<sub>2</sub>, and Ca(OH)<sub>2</sub> are marginally soluble.
- 6. Most sulfide (S<sup>2-</sup>), carbonate (CO<sub>3</sub><sup>2-</sup>), chromate (CrO<sub>4</sub><sup>2-</sup>), and phosphate (PO<sub>4</sub><sup>3-</sup>) salts are only slightly soluble.

EX 4: Complete and balance the equation: lead (II) nitrate + potassium iodide  $\rightarrow$ 

PB(NO3)2(09) + KI(09) -> PBIZ(5) + 2 KNO3(09)

Complete ion equation:

Pb2+ (ag) + 2 NO3 (ag) + 2K+ (ag) + 2I (ag) -> PbIz(s) + 2K+ (ag) + 2NO3 (ag)

Net ionic equation:

PBZ+ 2I ag > PBIZ(S)

EX 5: copper (II) sulfate + sodium hydroxide

EX 6: potassium nitrate + barium chloride

2 KNO3(ag) + Backz(ag) > 2 KC/ag+ Balnio3) zag

### Rules for Assigning Oxidation States

The oxidation state (OS) of an element corresponds to the number of electrons, e<sup>-</sup>, that an atom loses, gains, or appears to use when joining with other atoms in compounds. In determining the oxidation state of an atom, there are seven guidelines to follow:

- 1. The oxidation state of an individual atom is 0.
- 2. The total oxidation state of all atoms in: a neutral species is 0 and in an ion is equal to the ion charge.
- 3. Group 1 metals have an oxidation state of +1 and Group 2 an oxidation state of +2
- 4. The oxidation state of fluorine is -1 in compounds
- 5. Hydrogen generally has an oxidation state of +1 in compounds
- 6. Oxygen generally has an oxidation state of -2 in compounds
- 7. In binary metal compounds, Group 17 elements have an oxidation state of -1, Group 16 elements of -2, and Group 15 elements of -3.

Assign oxidation states for the following:

CO<sub>2</sub>

 $NO_3$ 

AgNO<sub>3</sub>

Assign oxidations states:

$$CH_4 + 2 O_2 \rightarrow CO_2 + 2 H_2O$$

$$2 \text{ PbS} + 3 \text{ O}_2 \rightarrow 2 \text{ PbO} + 2 \text{ SO}_2$$

## **Balancing redox reactions**

## 1. Neutral solutions

$$Cu^+_{(aa)} + Fe_{(s)} \rightarrow Fe^{3+}_{(aa)} + Cu_{(s)}$$

Step 1: Separate the half-reactions according to oxidation and reduction reactions.

$$Cu^+_{(aq)} \rightarrow Cu_{(s)}$$

$$Fe_{(s)} \rightarrow Fe^{3+}_{(aa)}$$

Step 2: Balance the charges by adding e to the other side.

$$Cu^+_{(aq)} + e^- \rightarrow Cu_{(s)}$$

$$Fe_{(s)} \rightarrow Fe^{3+}_{(aq)} + 3e^{-}$$

Step 3: Balance the electrons by multiplying the entire equation by a multiplier.

$$3 \text{ Cu}^+_{(aq)} + 3 \text{ e}^- \rightarrow 3 \text{ Cu}_{(s)}$$

$$Fe_{(s)} \rightarrow Fe^{3+}_{(aq)} + 3e^{-}$$

Step 4: Add the equations.

$$3 \text{ Cu}^+_{(aa)} + 3 \text{ e}^- + \text{Fe}_{(s)} \rightarrow 3 \text{ Cu}_{(s)} + \text{Fe}^{3+}_{(aa)} + 3 \text{ e}^-$$

Step 5: Cancel out the electrons

$$3 Cu^{+}_{(aq)} + Fe_{(s)} \rightarrow 3 Cu_{(s)} + Fe^{3+}_{(aq)}$$

#### 2. Acidic solutions

- Step 1: Separate the half-reactions according to oxidation and reduction reactions.
- Step 2: Balance elements OTHER than H and O.
- Step 3: Balance O by adding H<sub>2</sub>O to the other side.
- Step 4: Balance H by adding H<sup>+</sup> to the other side.
- Step 5: Balance the charges by adding e to the other side.
- Step 6: Balance the electrons by multiplying the entire equation by a multiplier.
- Step 7: Add the equations.
- Step 8: Cancel out the electrons.

### 3. Basic solutions

- Step 1: Separate the half-reactions according to oxidation and reduction reactions.
- Step 2: Balance elements OTHER than H and O.
- Step 3: Balance O by adding H<sub>2</sub>O to the other side.
- Step 4: Balance H by adding H<sup>+</sup> to the other side.
- Step 5: Balance the charges by adding e to the other side.
- Step 6: Balance the <u>electrons</u> by multiplying the <u>entire</u> equation by a multiplier.
- Step 7: Add the equations.
- Step 8: Cancel out the electrons.
- Step 9: Add OH<sup>-</sup> to eliminate H<sup>+</sup> ions.
- \*\*Remember: If it is a basic solution, do all of the steps above, then add OH to eliminate the H ions\*\*

EX 7:  $HCl_{(aq)} + KMnO_{4(aq)} \rightarrow H_2O_{(l)} + KCl_{(aq)} + MnCl_{2(aq)} + Cl_{2(g)}$ 

Net ionic equations:

 $Cr_2O_7^{2-}aq) + C_2H_5OH_{(I)} \rightarrow Cr^{3+} + CO_{2(q)}$ 

EX 9:  $S_{(s)} + HNO_{3(aq)} \rightarrow SO_{2(g)} + NO_{(g)} + H_{2}O_{(l)}$ RED: 4(3e-+4H++NO3 -> NO+2H2O) OXID: 3(2H20+ 5 -> SOZ+4H+44E) 12e-+16H++4NO3+6K20+3S->4NO+8K20+3SOz+12H++12e-35+4HNO3 -> 3502+4NO+2H20 EX 10:  $KMnO_{4(aq)} + FeSO_{4(aq)} + H_2SO_{4(aq)} \rightarrow K_2SO_{4(aq)} + MnSO_{4(aq)} + Fe_2(SO_4)_{3(qq)} + H_2O_{(l)}$ RED: 2 (5e-+8H++ MND4 -> Mn2+ +4H2O) 10 (Fez -> Fe3+1e-) 10/ Fez + 16H+ + 2Mn07 + 10Fe2 -> 2 Mg2+8H20+10Fe3++106-DKID: Single YOU CANTHAVE 2 KMnO4 + 10 FeSo4 + 8 H2504 -> K2SO4 + 2 MnSO4 + 5 Fed 504) + 8 H20 NOED IN TRANSPORT IN. You'd Balmerne

**Reminder	on	balancing	redox	reactions	in	basic	solutions**
------------	----	-----------	-------	-----------	----	-------	-------------

- 1) Use all the steps for an acid solution to obtain the final balanced equations
  - Identify the red-ox
  - Balance the elements
  - Balance the O with H<sub>2</sub>O
  - Balance the H with H<sup>+</sup>
  - Balance the charge with e
  - Equalize the e
- 2) Add OH- to eliminate the H+ ions

EX 11: The following reaction occurs in a basic solution. Balance this equation using the half-reaction method.

$$Zn_{(s)} + NO_{3(aq)} \rightarrow NO_{2(g)} + Zn^{2+}_{(aq)}$$

# 3) Acid-Base Reactions

Arrhenius definition:

Acid - Acid - Base - Base -

Strong Acid-Base reaction:

Weak Acid-Base reaction:

EX 12: What volume of 0.100 M HCl solution is needed to neutralize 25.0 mL of 0.350 M NaOH? Then replace HCl with H<sub>2</sub>SO<sub>4</sub>.

EX 13: In an experiment, 28 mL of 0.250 M HNO<sub>3</sub> and 53 mL of 0.320 M KOH are mixed. Calculate the amount of water formed in the reaction and calculate the concentration of H<sup>+</sup> or OH<sup>-</sup> in excess after the reaction goes to completion.

EX 14: A student carries out an experiment to standardize (determine the exact concentration of) a www-sodium hydroxide solution. To do this, the student masses out a 1.3009-gram sample of potassium hydrogen phthalate (KHC<sub>8</sub>H<sub>4</sub>O<sub>4</sub>, often abbreviated KHP). KHP, molar mass 204.22 g/mol, has one acidic hydrogen. The student dissolves the KHP in distilled water, adds phenolphthalein as an indicator, and titrates the resulting solution with the sodium hydroxide solution to the end-point. The difference between the final and initial burette readings indicates that 41.20 mL of the sodium hydroxide solution is required to react exactly with the KHP. Calculate the concentration of the sodium hydroxide solution.
